

Integrated Liner Technologies

The world's leading manufacturer of caps and septa.

SPME MicroCenter Septa™

Introducing the world's first septa specifically designed for automated SPME applications and instruments using the magnetic sample transport system. This uniquely designed liner has a micro thin center section, eliminating needle bending or breaking of the fiber during analysis.

The new ILT **MicroCenter Septa™** combines the tried and true functionality of standard thickness headspace septa with the exceptional piercability of a thinner center membrane. The thicker outside wall of the septa allows for a tight seal and prevents septa fall out, while the micro thin center remains easy to pierce with the smallest gauge needle.

The **MicroCenter Septa™** offers users the ability to use one cap and septa for multiple applications including SPME, as well as Dynamic and Static Headspace techniques.

Features

- Micro thin center
- Easy to pierce
- Seals tightly
- Molded for dimensional conformity
- Manufactured from low extractable silicone
- Available in 18mm screw caps and 20mm crimp caps
